

SOFTBRICK System

Stylex, 2026

SoftBrick is a modular lounge seating collection composed of multiple configurable elements, offering a high degree of flexibility. The system allows the creation of linear layouts, wide concave or convex curves, or combinations of both, enabling compositions that adapt naturally to different environments and spatial requirements.

Each module is designed with a complete 360-degree form, allowing the individual pieces to function equally well as standalone elements. This makes the collection suitable both for large open spaces, where multiple pieces can be arranged freely throughout the environment, and for smaller residential or corporate settings, where even one or two modules can create a strong spatial identity.

In addition to the seating modules, the collection includes a series of accessories that enrich its functionality and character: a tactile wooden side table that can be integrated between modules, power units for charging devices, and optional armrests. Another accessory is the base element, which allows the seating to be configured at two different heights.

The shape is soft and essential, designed to invite people to sit and relax. SoftBrick was conceived as an organic yet modular seating system, distinguished by refined stitching details that add depth and character to the overall design.
